

Do you know which planets orbit the sun in our solar system and did you know that the sun is a star

The Solar System

The solar system has many planets like Mercury, Venus, Earth, Mars, Jupiter, Uranus, Neptune, Pluto. The planets orbit one star that star is the sun that gives us light in the day but there is the moon that gives us the night so we can rest in peace because if the night did not exist we could not rest never and we have to be tired all the time.
