

Have you ever wondered how many stars are there?

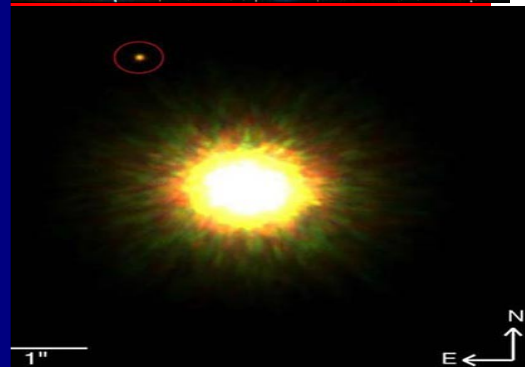

The Stars

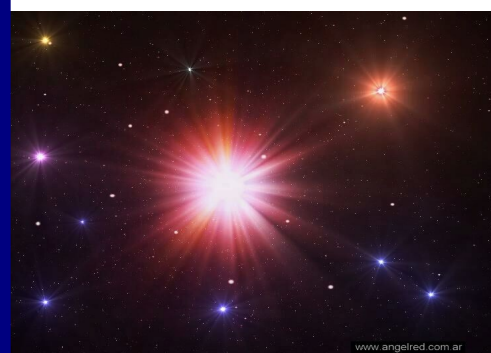

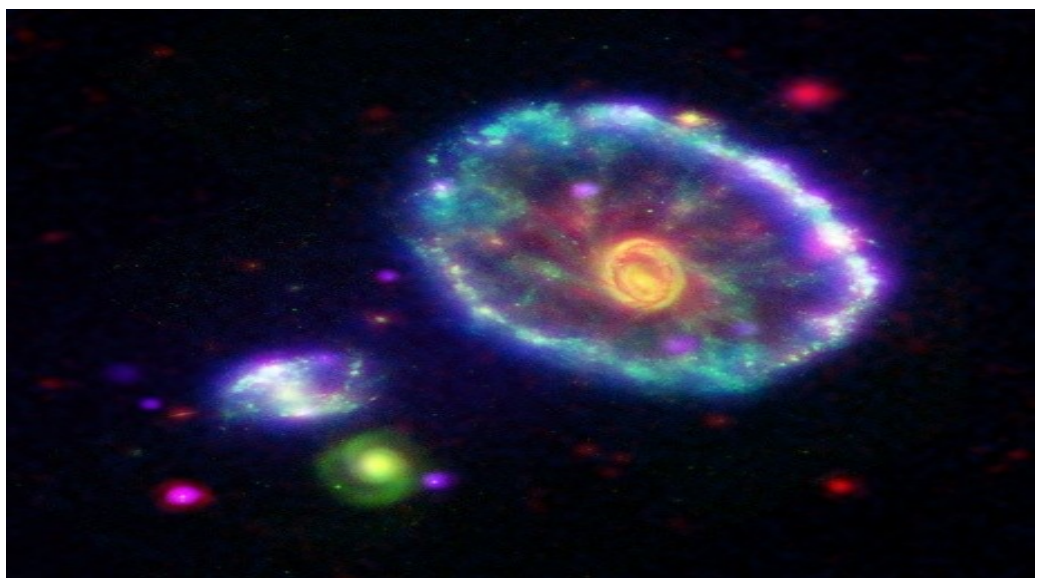

And how many of them we can see?

The number of stars we can observe with the naked eye from Earth is estimated at about 8,000, half in the northern celestial hemisphere and half in the south. At night you can not see more than 2,000 at the same time in each hemisphere. A conceal other atmospheric haze, especially near the horizon, and the pale light of heaven.

Looking at a starry night ?
